

ABSTRACT OF THE DISCLOSURE

A convergence system suitable for accepting inputs from several television or personal computing sources is disclosed. The sources can be output on a display. The
5 convergence system is controlled by a multi-function controller suitable for providing a set of function commands. A processor is coupled to the inputs, display and operably coupled to the controller wherein the processor responds to the function commands provided by the controller. The processor also creates for output on the display a set of channel banners. At least one of the channel banners provides information on
10 available processor functions and provides video feed-back when the processor is responding to the function commands.
